I live in _____, Pottsville NSW 2489 a complex of 50 townhouses. On the 28 February 2022 with very heavy rains our drains were coping. However that evening water starting coming up out of the stormwater drains. The high tide might have contributed to this? But we aren't below sea level as far as I know. If the stormwater drains were more efficient (wider) they might have better coped with the volume of water? 19 of our townhouses were fully flooded and a few more partially flooded (garages and sheds) - mine (number _____) was in the second category.

My request is that it be investigated if stormwater drains could be designed to cope with a larger flow of water.

Sincerely
